

1.

(a)

Represent the operation using 4×4 matrices that shows the mapping between the nodes.

$$\begin{aligned}
 T_1 &= \begin{pmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & 1 \end{pmatrix} & T_2 &= \begin{pmatrix} 1 & & & \\ & & 1 & \\ & 1 & & \\ & & & 1 \end{pmatrix} & T_3 &= \begin{pmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & 1 \end{pmatrix} \\
 T_4 &= \begin{pmatrix} & 1 & & \\ 1 & & & \\ & & 1 & \\ & & & 1 \end{pmatrix} & T_5 &= \begin{pmatrix} & 1 & & \\ & & 1 & \\ 1 & & & \\ & & & 1 \end{pmatrix} & T_6 &= \begin{pmatrix} & 1 & & \\ & & 1 & \\ & 1 & & \\ 1 & & & \end{pmatrix} \\
 T_7 &= \begin{pmatrix} & & 1 & \\ 1 & & & \\ & 1 & & \\ & & 1 & \end{pmatrix} & T_8 &= \begin{pmatrix} & & 1 & \\ & 1 & & \\ & & 1 & \\ 1 & & & \end{pmatrix} & T_9 &= \begin{pmatrix} & & 1 & \\ & & & 1 \\ 1 & & & \\ & 1 & & \end{pmatrix} \\
 T_{10} &= \begin{pmatrix} & & & 1 \\ 1 & & & \\ & 1 & & \\ & & 1 & \end{pmatrix} & T_{11} &= \begin{pmatrix} & & & 1 \\ & 1 & & \\ & & 1 & \\ 1 & & & \end{pmatrix} & T_{12} &= \begin{pmatrix} & & & 1 \\ & 1 & & \\ 1 & & & \\ & & 1 & \end{pmatrix}
 \end{aligned}$$

(b)

$$\begin{aligned}
 g_{123} &= \begin{pmatrix} & & 1 & \\ 1 & & & \\ & 1 & & \\ & & 1 & \end{pmatrix} \\
 g_{234} &= \begin{pmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ & & & 1 \end{pmatrix} \\
 g_{234}g_{123} &= \begin{pmatrix} & 1 & & \\ 1 & & & \\ & & 1 & \\ & & & 1 \end{pmatrix} = T_4
 \end{aligned}$$

(180° rotation around the the axis connecting the middle of 1-2 and 3-4)

$$g_{123}g_{234} = \begin{pmatrix} & & 1 & \\ 1 & & & \\ & 1 & & \\ & & 1 & \end{pmatrix} = T_9 \neq T_4$$

(c)

See (a)

(d)

$$H = \begin{pmatrix} \varepsilon_0 & -t & -t & -t \\ -t & \varepsilon_0 & -t & -t \\ -t & -t & \varepsilon_0 & -t \\ -t & -t & -t & \varepsilon_0 \end{pmatrix}$$

Eigenvalues are $\varepsilon_0 - 3t$ for eigenvector $\left(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}\right)$ and $\varepsilon_0 + t$ for eigenvectors, $\left(\frac{1}{2}, \frac{1}{2}, -\frac{1}{2}, -\frac{1}{2}\right)$, $\left(\frac{1}{2}, -\frac{1}{2}, \frac{1}{2}, -\frac{1}{2}\right)$, $\left(\frac{1}{2}, -\frac{1}{2}, -\frac{1}{2}, \frac{1}{2}\right)$.

2.

(a)

$$H = \begin{pmatrix} \varepsilon_0 & -t & & & -t & & -t \\ -t & \varepsilon_0 & -t & & -t & & \\ & -t & \varepsilon_0 & -t & & & -t \\ & & -t & \varepsilon_0 & -t & & \\ & -t & & -t & \varepsilon_0 & -t & \\ -t & & & -t & -t & \varepsilon_0 & -t \\ -t & & -t & & -t & \varepsilon_0 & \end{pmatrix}$$

Eigenvalues and eigenvectors are, $\lambda_1 = \varepsilon_0 - 3t$,

$$v_1 = \frac{1}{2\sqrt{2}} (1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1)$$

$\lambda_2 = \varepsilon_0 + 3t$,

$$v_2 = \frac{1}{2\sqrt{2}} (1 \ -1 \ 1 \ -1 \ 1 \ -1 \ 1 \ -1)$$

$\lambda_{3,4,5} = \varepsilon_0 - t$ (3-fold degenerate)

$$v_3 = \frac{1}{2} (1 \ 0 \ 0 \ -1 \ -1 \ 0 \ 0 \ 1)$$

$$v_4 = \frac{1}{2} (-1 \ -1 \ 0 \ 1 \ 0 \ 0 \ 1 \ 0)$$

$$v_5 = \frac{1}{2} (1 \ 0 \ -1 \ -1 \ 0 \ 1 \ 0 \ 0)$$

and $\varepsilon_0 + t$ (3-fold degenerate)

$$v_6 = \frac{1}{2} (-1 \ 0 \ 0 \ -1 \ 1 \ 0 \ 0 \ 1)$$

$$v_7 = \frac{1}{2} (-1 \ 1 \ 0 \ -1 \ 0 \ 0 \ 1 \ 0)$$

$$v_8 = \frac{1}{2} (-1 \ 0 \ 1 \ -1 \ 0 \ 1 \ 0 \ 0)$$

(b)

(c)

3.

The constraint is that the angular momentum cannot perfectly point in a certain direction and there will always be some fluctuations. This uncertainty comes from,

$$\begin{aligned}\langle \Delta L_x, \Delta L_y \rangle &\geq \frac{1}{2i} \langle [L_x, L_y] \rangle \\ &= \frac{\hbar}{2} \langle L_z \rangle \\ &= \frac{\hbar^2 m}{2}\end{aligned}$$

Which can only be 0 when $m = 0$.

4.

(a)

Define $g(\phi, \phi_0) \equiv e^{-iL_z \phi_0 / \hbar} f(\phi)$

$$\begin{aligned}\frac{\partial g}{\partial \phi_0} &= -\frac{iL_z}{\hbar} e^{-iL_z \phi_0 / \hbar} f(\phi) \\ &= -\frac{\partial}{\partial \phi} e^{-iL_z \phi_0 / \hbar} f(\phi) \\ &= -\frac{\partial g}{\partial \phi} \\ dg &= \frac{\partial g}{\partial \phi_0} d\phi_0 + \frac{\partial g}{\partial \phi} d\phi \\ &= \frac{\partial g}{\partial \phi} (d\phi - d\phi_0)\end{aligned}$$

Therefore $g = g(\phi - \phi_0)$ (since it has 0 gradient in this direction). Since $g(\phi) = f(\phi)$ (when $\phi_0 = 0$), $g(\phi, \phi_0) = f(\phi - \phi_0)$ for all ϕ_0 .

(b)

Define $\sigma_n \equiv \sigma \cdot \hat{n}$

$$\begin{aligned}(\sigma \cdot \hat{n})^2 &= n_x^2 + n_y^2 + n_z^2 \\ &= 1\end{aligned}$$

(using the fact that σ_i 's anti-commutes with each other)

$$\begin{aligned}
 e^{-i\sigma_n \varphi/2} &= \sum_{j=0}^{\infty} \frac{(-i\sigma_n \varphi/2)^j}{j!} \\
 &= \sum_{j=0}^{\infty} \frac{(-i\sigma_n \varphi/2)^{2j}}{(2j)!} + \sum_{j=0}^{\infty} \frac{(-i\sigma_n \varphi/2)^{2j+1}}{(2j+1)!} \\
 &= \sum_{j=0}^{\infty} \frac{(-1)^j (\varphi/2)^{2j}}{(2j)!} - i\sigma_n \sum_{j=0}^{\infty} \frac{(-1)^j (\varphi/2)^{2j+1}}{(2j+1)!} \\
 &= \cos \frac{\varphi}{2} - i\sigma_n \sin \frac{\varphi}{2}
 \end{aligned}$$

(c)

$$\begin{aligned}
 T_{x180} &= e^{-i\sigma_x \pi/2} \\
 &= \cos \frac{\pi}{2} - i\sigma_x \sin \frac{\pi}{2} \\
 &= -i\sigma_x
 \end{aligned}$$

which switches up and down spin with a phase factor. Spining around y-axis gives the same spin flip with a different phase factor.

(d)

$$\begin{aligned}
 T_{x90} &= e^{-i\sigma_x \pi/4} \\
 &= \cos \frac{\pi}{4} - i\sigma_x \sin \frac{\pi}{4} \\
 &= \frac{1}{\sqrt{2}}(1 - i\sigma_x)
 \end{aligned}$$

The effect on χ^+ ,

$$\begin{aligned}
 T_{x90}\chi^+ &= \frac{1}{\sqrt{2}}(1 - i\sigma_x)\chi^+ \\
 &= \frac{1}{\sqrt{2}}(\chi^+ - i\chi^-)
 \end{aligned}$$

(e)

$$\begin{aligned}
 T_{z180} &= e^{-i\sigma_z \pi} \\
 &= \cos \pi - i\sigma_z \sin \pi \\
 &= -1
 \end{aligned}$$

The global phase has no observable effect on this system. It could have non-trivial effect if it is possible to interfere this system with another one.

5.

(a)

For $n = 0$, $[A, B^0] = 0$ is true. When the equation is true for $n - 1$ we have,

$$\begin{aligned} [A, B^n] &= [A, B^{n-1}B] \\ &= [A, B^{n-1}]B + B^{n-1}[A, B] \\ &= (n-1)B^{n-2}[A, B]B + B^{n-1}[A, B] \\ &= (n-1)B^{n-1}[A, B] + B^{n-1}[A, B] \\ &= nB^{n-1}[A, B] \end{aligned}$$

So the equation is true for n as well. Therefore, the equation is true for all non-negative finite n .

Assume $f(x) \equiv \sum_{n=0}^{\infty} a_n x^n$

$$\begin{aligned} [p_x, f(x)] &= \left[p_x, \sum_{n=0}^{\infty} a_n x^n \right] \\ &= \sum_{n=0}^{\infty} [p_x, a_n x^n] \\ &= -i\hbar \sum_{n=0}^{\infty} a_n n x^{n-1} \\ &= -i\hbar \sum_{n=0}^{\infty} a_n \frac{\partial x^n}{\partial x} \\ &= -i\hbar \frac{\partial}{\partial x} \sum_{n=0}^{\infty} a_n x^n \\ &= -i\hbar \frac{\partial f(x)}{\partial x} \end{aligned}$$

(b)

$$\begin{aligned} \frac{d}{dt} \vec{L}_{op} &= \frac{i}{\hbar} [H, \vec{L}] \\ &= \frac{i}{\hbar} \left[\frac{p^2}{2m} + V, \vec{x} \times \vec{p} \right] \\ &= \frac{i}{\hbar} \left[\frac{p^2}{2m}, \vec{x} \right] \times \vec{p} + \frac{i}{\hbar} \vec{x} \times [V, \vec{p}] \\ &= \frac{-i}{2m\hbar} 2i\hbar \vec{p} \times \vec{p} + \frac{i}{\hbar} \vec{x} \times i\hbar \nabla V \\ &= -\vec{x} \times \nabla V \\ &= \vec{N}_{op} \end{aligned}$$

(c)

If V is spherically symmetric, $\nabla V \parallel \vec{x}$ so $\vec{N}_{op} = -\vec{x} \times \nabla V = 0$ (since everything commutes...)
